Managing Jobs

Jobs are executed in parallel on the cloud. The degree of parallelism is chosen automatically based on your plan, your remaining capacity, and the size of our cluster at that time.

You can view job information and set job priority using TD Console or using TD Toolbelt.

Optionally and upon request, resource pools can be used to help with priority and job processing. For more information, see Hive and Other Hadoop Based Resource Pools.

- TD Toolbelt Job and Query Command Reference
- Setting Job Priority
- Scheduling
- Sharing Jobs
