

# Scheduling a Workflow from within the Workflow Definition

The following is an example of the syntax you add to your workflow definition to run the workflow everyday at 12AM.

When you add a schedule to your workflow, if you attempt to select **New Run** to run the workflow immediately, you are likely to get an error. The workflow must run at the specified scheduled time.

1. Add the following code to the workflow definition:

```
timezone: America/Chicago
schedule:
  daily>: 00:00:00
```

## mywftest

prj

The screenshot shows a web interface for editing a workflow definition. At the top, there are two tabs: 'Run History' and 'Workflow Definition', with the latter being selected. Below the tabs is a code editor for a file named 'mywftest.dig'. The code is as follows:

```
1  _export:
2    td:
3      database:
4        workflow_temp
5  timezone: America/Chicago
6
7  schedule:
8    daily>: 00:00:00
9
10 +daily:
11   td>: queries/daily\_open
12       .sql
13   create_table: daily_open
```

To the right of the code editor, there is a sidebar with the text 'Project' and 'This l' and 'the c'. There are two right-pointing arrow buttons and a double vertical bar icon.
