## Why am I not seeing my actions in the audit log?

It might take up to 10 minutes for an event to appear in the audit log. There is a period of latency between the action and the logging of the event.

## Are data connector activities such as export results logged?

Most data connector activities are captured as job events. No logged job action exists for exporting data in a query.

In the Premium audit log, you can see job result download as an event. If you download a result, for example as a CSV or TSV, it is recorded as `job_result_download` event. You can also see a preview of job results as an event: `job_result_show` event.

Job events cover several data connector activities as well as Hive and Presto queries.

## What is the difference between an audit trail and audit log?

In some cases, audit log and audit trail are used interchangeably. Generally:

- **Audit Logs.** (Supported) Informs you what an actor (user or entity) did. The log monitors who did what, and when.
- **Audit Trails** tell you what sequence of actions occurred for a certain state to be created. You use trails to confirm how and why the system or the data is in a certain state.

Treasure Data offers audit logs, not audit trails.
