

# Dropping Columns Filter

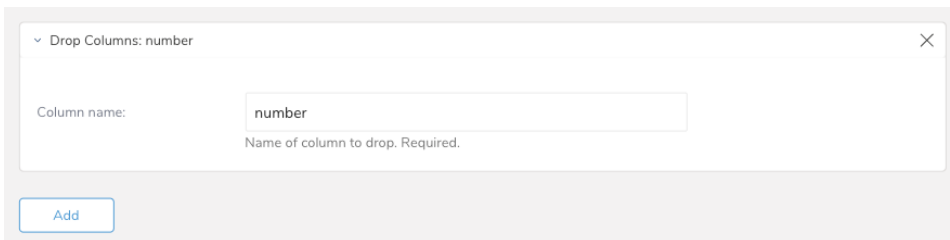

The Drop Columns filter allows you to drop a column from the data you are importing.

For example, if your marketing team wants a list of customer information such as name, email, address, phone, and certain preferences and that data exists in a table that also contains some sensitive information or values that are not needed, you can drop those columns.

To apply the Drop Columns filter:

1. Select **Drop Columns**.
2. Select **Add Filter**.
3. Select **Add**.

The Drop Columns dialog opens.

4. Edit the name of the column to drop.
5. Optionally, do one of the following:
  - a. If you are finished with Filters, select **Next**.
  - b. If you want to add another filter, select **Add** and repeat the steps.
