

# Firestore Cloud Messaging Export Integration

Firestore is a mobile- and web application development platform that helps you deliver richer app experiences. You can send direct notifications to your mobile app and website through Firestore Cloud Messaging.

The Realtime Database and Cloud Firestore can stock document-structured data and synchronize the corresponding apps in milliseconds whenever a data transformation occurs. The app and its database listen to each other, providing your customers with a more reactive app experience. Using Firestore **Cloud Functions** you can write backend code to respond to events happening in the Firestore platform without having to deal with any servers.

- [Prerequisites](#)
- [Use the TD Console to Create Your Connection](#)
  - [Create a New Connection](#)
- [Example Service Account JSON File](#)
  - [Configure Export Results in Your Data Connection](#)
    - [Configure the Connection by Specifying the Parameters](#)
  - [Example of a Query to Populate Firestore](#)
  - [Optionally Use Scheduled Jobs for Export](#)
  - [Optionally Configure Export Results in Workflow](#)

## Prerequisites

- Basic knowledge of Treasure Data, including the [TD Toolbelt](#).
- A Google Firestore Project.
- For substitution, NULL values will be truncated to "" (empty string). If the substitution is for a numeric column, there will be a warning and the record is skipped.
- Because the messages are sent individually, we will not revert the whole sessions. The error messages are logged to the TD Console, but the job will continue.
- Strong knowledge of the Firestore message template structure.

## Use the TD Console to Create Your Connection

### Create a New Connection

When you configure a data connection, you provide authentication to access the integration. In Treasure Data, you configure the authentication and then specify the source information.

1. Open TD Console.
2. Navigate to Integrations Hub > Catalog.
3. Search for and select Firestore.

The following dialog opens.

Service Account JSON File:

```
{ "type": "service_account", "private_key_id": ...
```

Paste the credentials of a service account created on Google Developer Console

[Learn more](#)

Continue

4. Type or paste the credential from your [Google Developer Console service account](#).

**Legacy credentials**

**Database secrets**

**Other service accounts**

5 service accounts from Google Cloud Platform

**Firebase Admin SDK**

Your Firebase service account can be used to authenticate multiple Firebase features, such as Database, Storage and Auth, programmatically via the unified Admin SDK. [Learn more](#)

Firestore service account  
firebase-adminsdk-ui5s9@megmiranda-95.iam.gserviceaccount.com

Admin SDK configuration snippet

Node.js  Java  Python  Go

```
var admin = require("firebase-admin");  
  
var serviceAccount = require("path/to/serviceAccountKey.json");  
  
admin.initializeApp({  
  credential: admin.credential.cert(serviceAccount),  
  databaseURL: "https://megmiranda-95.firebaseio.com"  
});
```

Generate new private key

For example:

```
{  
  "type": "service_account",  
  "project_id": "megmida-95",  
  "private_key_id": "e793538838c9daa051b2b2f48eea31e10cf46f75",  
  "private_key": "-----BEGIN PRIVATE KEY-----\nMIIEVgIBADA.....br8RqYJePR6sU+68QfAF\n-----END PRIVATE KEY-----\n",  
  "client_email": "firebase-adminsdk-ui5s9@megmida-95.iam.gserviceaccount.com",  
  "client_id": "114220230186840911629",  
  "auth_uri": "https://accounts.google.com/o/oauth2/auth",  
  "token_uri": "https://oauth2.googleapis.com/token",  
  "auth_provider_x509_cert_url": "https://www.googleapis.com/oauth2/v1/certs",  
  "client_x509_cert_url": "https://www.googleapis.com/robot/v1/metadata/x509/firebase-adminsdk-ui5s9@megmida-95.iam.gserviceaccount.com"  
}
```

5. Select **Done**.

# Example Service Account JSON File

A sample JSON file:

```
{
  "type": "service_account",
  "project_id": "[PROJECT-ID]",
  "private_key_id": "[KEY-ID]",
  "private_key": "-----BEGIN PRIVATE KEY-----\n[PRIVATE-KEY]\n-----END PRIVATE KEY-----\n",
  "client_email": "[SERVICE-ACCOUNT-EMAIL]",
  "client_id": "[CLIENT-ID]",
  "auth_uri": "https://accounts.google.com/o/oauth2/auth",
  "token_uri": "https://accounts.google.com/o/oauth2/token",
  "auth_provider_x509_cert_url": "https://www.googleapis.com/oauth2/v1/certs",
  "client_x509_cert_url": "https://www.googleapis.com/robot/v1/metadata/x509/[SERVICE-ACCOUNT-EMAIL]"
}
```

- See [Firebase document](#) to create a new service account key.

## Configure Export Results in Your Data Connection

In this step, you create or reuse a query. In the query, you configure the data connection.

### Configure the Connection by Specifying the Parameters

1. Open the TD Console.
2. Navigate to **Data Workbench > Queries**.
3. Select the query that you plan to use to export data.
4. Select **Export Results** located at top of your query editor. The Choose Integration dialog opens. You have two options when selecting a connection to use to export the results, using an existing connection or creating a new one.

### Choose Integration ✕

Use Existing Integration

Create New Integration

Type

Firebase Cloud Messaging

Name

Untitled Integration

Share with others

Service Account JSON File:

```
{ "type": "service_account", "private_key_id": ...
```

Paste the credentials of a service account created on Google Developer Console

Next

5. Use an existing connection
  - a. Type the connection name in the search box to filter.
  - b. Select your connection
6. Specify the export details.

## Export Results

### Integration: demo

Project ID:   
Firebase project id(i.e the unique identifier for your Firebase project)

Message Template:   
 **Fast Mode**  
Enable to run with no validations, no error logs and no retries

Max Retries:   
Maximum number of retries when an error occurred

Initial Retry Time Wait in Millis:

Max Retry Wait in Millis:

- **Project Id:** project ID of your Firebase project.
- **Message Template:** the connector replaces all substitution columns and aliases (`__column_name__`) in the template to the individual messages to send Firebase Message. All substitution columns and aliases exist in the export data.
- **Fast Mode:** Enable parallel run with no validations, no errors logs and no retries. Default: false
- **Max retries** (optional): Number of retries before the system gives up. Default: 7.
- **Initial retry time wait in milliseconds** (optional): The time, in milliseconds, between the first and second attempt. Default: 500, which is equivalent to 0.5 seconds.
- **Max retry wait in milliseconds** (optional): The time, in milliseconds, between the second and all subsequent attempts. Default: 300000, which is equivalent to 5 minutes.

The following is a sample template configuration:

Error rendering macro 'code': Invalid value specified for parameter 'com.atlassian.confluence.ext.code.render.InvalidValueException'

```
{
  "message": {
    "notification": {
      "title": "__title__",
      "body": "__body__"
    },
    "topic": "weather"
  }
}
```

## Export Results

### Integration: demo

Project ID:   
Firestore project id(i.e the unique identifier for your Firestore project)

Message Template: 

```
{
  "message": {
    "notification": {
      "title": "__title__",
      "body": "__body__"},
    "topic": "weather"}
}
```

Fast Mode  
Enable to run with no validations, no error logs and no retries

Max Retries:   
Maximum number of retries when an error occurred

Initial Retry Time Wait in Millis:

Max Retry Wait in Millis:

Delete

Done

## Example of a Query to Populate Firestore

From Treasure Data, run the following query and export results to a connection for Firestore:

```
Select 'test_body' as body, 'test_title' as title
```

## Optionally Use Scheduled Jobs for Export

You can use Scheduled Jobs with Result Export, to periodically write the output result to a target destination that you specify.

## Optionally Configure Export Results in Workflow

Within Treasure Workflow, you can specify the use of this data connector to export data.

```
timezone: UTC

_export:
  td:
    database: sample_datasets

+td-result-into-firebase:
  td>: queries/sample.sql
  result_connection: your_connections_name
  result_settings:
    service_account_json: '{"type":"service_account","project_id":"project_id","private_key_id":"#####"}'
    project_id: project_id
    message_template: {"message":{"notification":{"title":"__title__","body":"__body__"},"topic":"weather"}}
    fast_mode: true
    retry_count: 7
    retry_initial_wait_millis: 500
    max_retry_wait_millis: 300000
```

Optionally, read more information on using data connectors in [workflow to export data](#).
