Administration

This section describes the administration tasks for Treasure Data (TD). After you finish configuring your TD products, you can use this guide to further customize and configure your TD environment.

TD can use data from many different data sources, recombine it, and make it available to many different destinations. As an administrator, you can manage data sources, multiple connection and security protocols, complex data access methods, multi-level security, usage, and audit logs.

You need to perform most administration tasks periodically, but not necessarily daily. The following are the main TD administration tasks:

- Setup and Configuration
- Security
- About My Settings
- About the Control Panel
- Users
- Data Retention Policy
- Audit Logs
- IP Whitelist
- Utilization
